[Authorized Security Simulation / Incident Resolution Report]

Incident Summary:

An alert was triggered indicating a high-severity anomalous event: A test user account was accessed via an anonymizing network (Tor Exit Node), followed immediately by unauthorized configuration deletions and directory modifications.

Investigation Findings:

Full triage via the Sentinel Investigation Graph confirmed a simulated credential compromise scenario. The threat actor leveraged the Tor network to mask their identity and executed unauthorized administrative actions, specifically deleting critical system configurations to cause service disruption.

Remediation Actions Taken:

1. Account Containment: The compromised test user account was immediately disabled in Microsoft [99684c53-5c5a-43f1-af7a-313ccd714435] ID, and all active OAuth tokens/sessions were revoked.
2. Configuration Recovery: Unauthorized changes were audited via Log Analytics, and configurations were rolled back to the secure baseline.
3. Network Defense: The malicious Tor Exit Node IP address was extracted from the SigninLogs and flagged for blocklisting at the firewall level.

Resolution Status:

Threat successfully contained and blast radius minimized. The incident is being closed as 'Resolved' (True Positive - Handled during an authorized security simulation drill).
